

# The Iridium<sup>®</sup> Network

**GLOBAL** – The only network that provides 100% coverage from pole to pole

**SECURE** – Sensitive voice and data are routed through dedicated gateways, so they never touch the ground and are less likely to be intercepted

**MISSION CRITICAL** – Provides connectivity even when ground infrastructure is compromised or non-existent in deeply emplaced missions

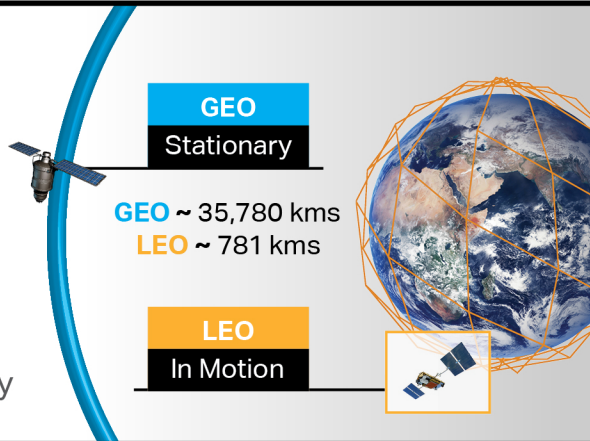

## SMALL FORM DEVICES

Light-weight devices with smaller form-factor antennas that enable unprecedented levels of mobility and portability

## REAL TIME CONNECTION

Iridium's Low-Earth Orbit (LEO) constellation is closer to the Earth than Geostationary satellites (GEO), thus enabling lower latency

## FLEXIBLE COVERAGE

Iridium satellites deliver improved performance over GEO systems in compromised locations like canyons, behind large obstructions and in urban areas
